1 Introduction

Using an arc length integral it is possible to show that the circumference, C, of an ellipse with eccentricity e and semi-major axis a is

$$C = 4a \int_0^{\pi/2} \sqrt{1 - e^2 \sin^2 x} \ dx$$

In Section 1.1 we setup the integral to be turned into an infinite sigma summation. In Section 2 this is evaluated. In Section 3 we consider a specific case of e, using a trigonometric identity to derive a closed form for a nice infinite sum.

1.1 Problem setup

The integral is

$$C = 4a \int_0^{\pi/2} (1 - e^2 \sin^2 x)^{\frac{1}{2}} dx$$
 (1)

We will use the binomial expansion for nonintegers on $(1 - e^2 \sin^2 x)^{\frac{1}{2}}$, then integrate term by term. Lemmas 5.1 and 5.2 will be referenced and can be found in the appendix.

2 Algebra crunching

Recalling (1), note that $0 \le e < 1 \implies e^2 \sin^2 x < 1$ so we can use the binomial expansion.

$$C = 4a \int_0^{\pi/2} \left(1 + \sum_{k>1} \frac{\frac{1}{2} \times -\frac{1}{2} \times \dots \times (\frac{1}{2} - k + 1)}{k!} (-e^2 \sin^2 x)^k \right) dx$$

Integrate term by term (sum and integral are interchanged):

$$= 2\pi a + 4a \sum_{k>1} \frac{\frac{1}{2} \times \dots \times (\frac{3}{2} - k)}{k!} (-1)^k e^{2k} \int_0^{\pi/2} \sin^{2k} x \ dx$$

Substitute Lemma 5.1 in:

$$= 2\pi a + 4a \sum_{k\geq 1} \frac{\frac{1}{2} \times \dots \times (\frac{3}{2} - k)}{k!} (-1)^k e^{2k} \frac{\pi}{2} \prod_{n=1}^k \frac{2n - 1}{2n}$$

$$= 2\pi a + 2\pi a \sum_{k\geq 1} \frac{\prod_{n=1}^k (2n - 3)}{2^k k!} e^{2k} \prod_{n=1}^k \frac{2n - 1}{2n}$$

$$= 2\pi a + 2\pi a \sum_{k\geq 1} \frac{\prod_{n=1}^k (2n - 3) \prod_{n=1}^k (2n - 1)}{2^k k! \prod_{n=1}^k (2n)} e^{2k}$$

$$= 2\pi a \left(1 + \sum_{k\geq 1} \frac{\prod_{n=1}^k (2n - 3) (2n - 1)}{4^k (k!)^2} e^{2k} \right)$$

Substitute Lemma 5.2 in:

$$= 2\pi a \left(1 + \sum_{k \ge 1} \frac{(1 - 2k) \left[\frac{(2k - 2)!}{(k - 1)!} \right]^2}{4^{k - 1} 4^k (k!)^2} e^{2k} \right)$$

$$= 2\pi a \left(1 + \sum_{k \ge 1} \frac{-1}{4^{2k - 1} (2k - 1)} \left[\frac{(2k - 1)(2k - 2)!}{k!(k - 1)!} \right]^2 e^{2k} \right)$$

$$= 2\pi a \left(1 - \sum_{k \ge 1} \frac{4^{1 - 2k}}{2k - 1} \binom{2k - 1}{k - 1}^2 e^{2k} \right)$$

Reindex:

$$=2\pi a \left(1 - \sum_{k \ge 0} \frac{4^{-1-2k}}{2k+1} {2k+1 \choose k}^2 e^{2k+2}\right)$$

$$C = \frac{\pi a}{2} \left(4 - \sum_{k=0}^{\infty} \frac{\binom{2k+1}{k}^2 e^{2k+2}}{16^k (2k+1)} \right)$$
 (2)

Note when e = 0 (the ellipse is a circle) the whole summation vanishes so C becomes $2\pi a$, as expected.

3 A specific case

We will evaluate (1) for a specific value of e, then equate the result with (2). Recall (1) and set $e^2 = \frac{1}{2}$:

$$C\Big|_{e^2=1/2} = 4a \int_0^{\pi/2} (1 - \frac{1}{2}\sin^2 x)^{\frac{1}{2}} dx$$

Using the identity $sin^2x + cos^2x \equiv 1$:

$$= 4a \int_0^{\pi/2} (\frac{1}{2} + \frac{1}{2}\cos^2 x)^{\frac{1}{2}} dx$$
$$= 2a\sqrt{2} \int_0^{\pi/2} (1 + \cos^2 x)^{\frac{1}{2}} dx$$

Note that $0 \le x < \pi/2 \implies \cos^2 x < 1$ So now we can use the binomial expansion.

$$= 2a\sqrt{2} \int_0^{\pi/2} \left(1 + \sum_{k \ge 1} \frac{\frac{1}{2} \times -\frac{1}{2} \cdots \times (\frac{1}{2} - k + 1)}{k!} (\cos^2 x)^k \right) dx$$

Integrate term by term (sum and integral are interchanged):

$$= \pi a \sqrt{2} + 2a\sqrt{2} \sum_{k>1} \left(\frac{\prod_{n=1}^{k} (3-2n)}{2^{k} k!} \int_{0}^{\pi/2} \cos^{2k} x \, dx \right)$$

Substitute Lemma 5.1 in:

$$= \pi a \sqrt{2} + 2a\sqrt{2} \sum_{k \ge 1} \left(\frac{\prod_{n=1}^{k} (3-2n)}{2^k k!} \frac{\pi}{2} \prod_{n=1}^{k} \frac{2n-1}{2n} \right)$$

$$= \pi a \sqrt{2} + \pi a \sqrt{2} \sum_{k \ge 1} \left((-1)^k \frac{\prod_{n=1}^{k} (2n-3) \prod_{n=1}^{k} (2n-1)}{2^k k! \prod_{n=1}^{k} 2n} \right)$$

$$= \pi a \sqrt{2} \left(1 + \sum_{k \ge 1} \left((-1)^k \frac{\prod_{n=1}^{k} (2n-3) (2n-1)}{4^k (k!)^2} \right) \right)$$

Substitute Lemma 5.2 in:

$$= \pi a \sqrt{2} \left(1 + \sum_{k \ge 1} \left((-1)^k \frac{(1-2k) \left[\frac{(2k-2)!}{(k-1)!} \right]^2}{4^{k-1} 4^k (k!)^2} \right) \right)$$

$$= \pi a \sqrt{2} \left(1 + \sum_{k \ge 1} \left((-1)^{k+1} \frac{1}{(2k-1)4^{2k-1}} \left[\frac{(2k-1)(2k-2)!}{k!(k-1)!} \right]^2 \right) \right)$$

$$= \pi a \sqrt{2} \left(1 + \sum_{k \ge 1} \left(\frac{(-1)^{k+1} 4^{1-2k}}{2k-1} {2k-1 \choose k-1}^2 \right) \right)$$

Reindex:

$$= \pi a \sqrt{2} \left(1 + \sum_{k \ge 0} \frac{(-1)^k 4^{-1-2k}}{2k+1} {2k+1 \choose k}^2 \right)$$

$$C \Big|_{e^2 = 1/2} = \frac{\pi a \sqrt{2}}{4} \left(4 + \sum_{k \ge 0} \frac{(-1)^k 16^{-k}}{2k+1} {2k+1 \choose k}^2 \right)$$

But note, if we evaluate C when $e^2 = \frac{1}{2}$ using (2) we get:

$$C\Big|_{e^2=1/2} = \frac{\pi a}{2} \left(4 - \sum_{k \ge 0} \frac{\binom{2k+1}{k}^2}{(2k+1)16^k} \cdot \frac{1}{2^{k+1}} \right)$$

Thus:

$$\frac{\pi a\sqrt{2}}{4} \left(4 + \sum_{k \ge 0} \frac{(-1)^k 16^{-k}}{2k+1} {2k+1 \choose k}^2 \right) = \frac{\pi a}{2} \left(4 - \sum_{k \ge 0} \frac{16^{-k} {2k+1 \choose k}^2}{2k+1} \frac{1}{2^{k+1}} \right)$$

Now simplify:

$$\sqrt{2} \left(4 + \sum_{k \ge 0} \frac{(-1)^k 16^{-k}}{2k+1} {2k+1 \choose k}^2 \right) = 2 \left(4 - \sum_{k \ge 0} \frac{16^{-k} {2k+1 \choose k}^2}{2k+1} \frac{1}{2^{k+1}} \right)$$

$$4\sqrt{2} + \sum_{k \ge 0} \sqrt{2} \frac{(-1)^k 16^{-k}}{2k+1} {2k+1 \choose k}^2 = 8 - \sum_{k \ge 0} \frac{16^{-k} {2k+1 \choose k}^2}{(2k+1)2^k}$$

$$\sum_{k \ge 0} \frac{16^{-k} {2k+1 \choose k}^2}{(2k+1)2^k} + \sum_{k \ge 0} \sqrt{2} \frac{(-1)^k 16^{-k}}{2k+1} {2k+1 \choose k}^2 = 8 - 4\sqrt{2}$$

$$\sum_{k \ge 0} \frac{16^{-k} {2k+1 \choose k}^2}{2k+1} \left(\frac{1}{2^k} + \sqrt{2}(-1)^k \right) = 8 - 4\sqrt{2}$$

$$\sum_{k \ge 0} \frac{32^{-k} {2k+1 \choose k}^2}{2k+1} \left(1 + \sqrt{2}(-2)^k \right) = 8 - 4\sqrt{2}$$

$$\sum_{k=0}^{\infty} \frac{\binom{2k+1}{k}^2 \left(1 + \sqrt{2}(-2)^k\right)}{(2k+1)32^k} = 8 - 4\sqrt{2}$$
 (3)

Nice.

4 Summary

I have derived two infinite sums, (2) and (3). One is a sum that I have found a closed form for:

$$\sum_{k=0}^{\infty} \frac{\binom{2k+1}{k}^2 \left(1 + \sqrt{2}(-2)^k\right)}{(2k+1)32^k} = 8 - 4\sqrt{2}$$

And the other is the circumference, C, of an ellipse with eccentricity e and semi-major axis a:

$$C = \frac{\pi a}{2} \left(4 - \sum_{k=0}^{\infty} \frac{\binom{2k+1}{k}^2 e^{2k+2}}{16^k (2k+1)} \right)$$

Note that we may calculate the first few coefficients of e in the sum, say up to k=5:

$$C\approx 2\pi a - \frac{\pi a e^2}{2} - \frac{3\pi a e^4}{32} - \frac{5\pi a e^6}{128} - \frac{175\pi a e^8}{8192} - \frac{441\pi a e^{10}}{32768}$$

This approximation should be more accurate when the eccentricity is small.

5 Appendix

5.1 Lemma

Claim: $\int_0^{\pi/2} \sin^{2k} x \, dx = \int_0^{\pi/2} \cos^{2k} x \, dx = \frac{\pi}{2} \prod_{n=1}^k \frac{2n-1}{2n}$ The proof is below.

Firstly, note

$$\int_0^{\pi/2} \sin^{2k} x \, dx = \int_0^{\pi/2} \cos^{2k} \left(\frac{\pi}{2} - x\right) dx$$

so $\int_0^{\pi/2} \sin^{2k}x \, dx = \int_0^{\pi/2} \cos^{2k}x \, dx$ can be verified by doing a substitution with $u=\frac{\pi}{2}-x$.

It remains to show that $I_k := \int_0^{\pi/2} \sin^{2k} x \, dx = \frac{\pi}{2} \prod_{n=1}^k \frac{2n-1}{2n}$

$$I_{k} = \int_{0}^{\pi/2} \sin^{2k-1} x \sin(x) dx$$
Using IBP:
$$= -\sin^{2k-1} x \cos(x) \Big|_{0}^{\pi/2} + (2k-1) \int_{0}^{\pi/2} \sin^{2k-2} x \cos^{2} x dx$$

$$= (2k-1) \int_{0}^{\pi/2} \left(\sin^{2k-2} x - \sin^{2k} x\right) dx$$

$$= (2k-1) \int_{0}^{\pi/2} \sin^{2k-2} x dx - (2k-1) \int_{0}^{\pi/2} \sin^{2k} dx$$

$$\therefore I_{k} + (2k-1)I_{k} = (2k-1)I_{k-1}$$

$$I_{k} = \frac{2k-1}{2k} I_{k-1}$$

Note that $I_0 = \frac{\pi}{2}$

$$\therefore I_k = \frac{2k-1}{2k} \times \frac{2k-3}{2k-2} \times \dots \times \frac{1}{2}I_0 = \frac{\pi}{2} \prod_{n=1}^k \frac{2n-1}{2n}$$

Done.

5.2Lemma

5.2 Lemma
Claim:
$$\prod_{n=1}^{k} (2n-3)(2n-1) = \frac{1-2k}{4^{k-1}} \left[\frac{(2k-2)!}{(k-1)!} \right]^2$$
Proof:
$$\prod_{n=1}^{k} (2n-3)(2n-1) = (-1\times1)\times(1\times3)\times\cdots\times[(2k-3)\times(2k-1)]$$

$$= -1\times1^2\times3^2\times\cdots\times(2k-3)^2\times(2k-1)$$

$$= (1-2k)\left[1\times3\times\cdots\times(2k-3)\right]^2$$

$$= (1-2k)\left[\frac{1\times2\times3\times\cdots\times(2k-3)\times(2k-2)}{2\times4\times\cdots\times(2k-2)}\right]^2$$

$$= \frac{1-2k}{4^{k-1}}\left[\frac{(2k-2)!}{(k-1)!}\right]^2$$
